Diabetes Prediction Regression Analysis

Manas Reddy

2025-05-02

Introduction

This document presents a regression analysis workflow to predict Fasting_Blood_Glucose using the provided diabetes dataset. The process includes data loading, exploratory data analysis, preprocessing, and training a LightGBM regression model.

Load Libraries

```
library(readr)
library(dplyr)
library(ggplot2)
library(reshape2)
library(caret) # For train/test split
library(lightgbm) # For LightGBM model
library(corrplot) # For correlation plot
```

Load Data

```
# Load the dataset
df <- read_csv('diabetes_dataset.csv')</pre>
```

Initial Data Inspection

```
# Check for missing values
cat("Missing values per column:\n")
```

Missing values per column:

```
print(colSums(is.na(df)))
```

```
## ...1 Age
## 0 0
## Sex Ethnicity
## 0
```

```

```

Exploratory Data Analysis: Distributions

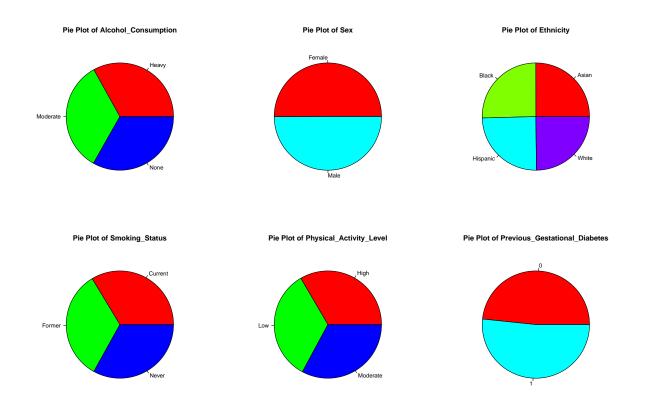

Histograms are plotted for selected numerical features. Categorical features are visualized later using pie charts.

```
# Plot histograms
hist_cols <- c('Age', 'Dietary_Intake_Calories', 'Fasting_Blood_Glucose', 'BMI')
par(mfrow=c(2, 2))
for (col in hist_cols) {
   hist(df[[col]], main = paste(col, 'Distribution'), xlab = col, probability = TRUE, col = 'lightblue',
   lines(density(df[[col]], na.rm = TRUE), col = 'blue', lwd = 2)
}</pre>
```

Pie charts are used to visualize the distribution of categorical variables.

```
# Plot pie charts
pie_cols <- c('Alcohol_Consumption', 'Sex', 'Ethnicity', 'Smoking_Status', 'Physical_Activity_Level', '
par(mfrow=c(2, 3))
for (col in pie_cols) {
   counts <- table(df[[col]])
   pie(counts, main = paste('Pie Plot of', col), col = rainbow(length(counts)))
}</pre>
```

```
par(mfrow=c(1, 1))
```

Data Preprocessing

Handling missing values and converting categorical columns to factors.

```
# Fill missing values in 'Alcohol_Consumption'
df$Alcohol_Consumption[is.na(df$Alcohol_Consumption)] <- 'Not Reported'
cat("Missing values after filling Alcohol_Consumption:\n")</pre>
```

Missing values after filling Alcohol_Consumption:

```
print(colSums(is.na(df)))
```

```

Exploratory Data Analysis: Boxplots

Boxplots help visualize the distribution and potential outliers for numerical features, and also distributions of a numerical feature across categories (when used with a factor on the x-axis, although here we plot single distributions).

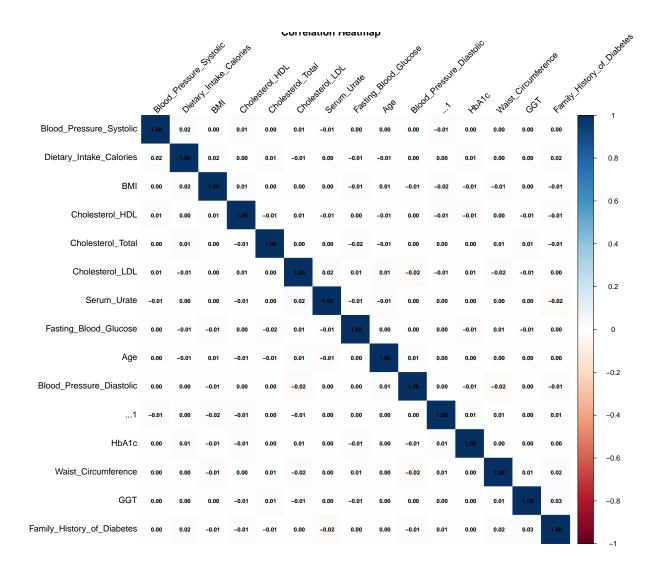

```
# Plot boxplots
boxplot_cols <- c('Age', 'Dietary_Intake_Calories', 'Fasting_Blood_Glucose', 'BMI', 'Alcohol_Consumption
par(mfrow=c(2, 3)) # Arrange plots in a 2x3 grid
for (col in boxplot_cols) {
    # Boxplot for a single variable
    boxplot(df[[col]], main = paste('Box Plot of', col), ylab = col)
    # Note: For categorical vs numeric, boxplot(Numeric ~ Factor, data = df) is standard
}</pre>
```

```
par(mfrow=c(1, 1)) # Reset plot layout
```

Correlation Analysis

Visualizing the correlation matrix of numerical features.

Data Splitting

Splitting the data into training and testing sets (80/20 split).

```
# Prepare data for LightGBM
# Drop the index column (read as '...1') and 'Fasting_Blood_Glucose' from features
X <- df %>% select(-`...1`, -Fasting_Blood_Glucose)
y <- df$Fasting_Blood_Glucose

# Split data into training and testing sets
set.seed(42) # for reproducibility
train_indices <- createDataPartition(y, p = 0.8, list = FALSE)
X_train <- X[train_indices, ]
X_test <- X[-train_indices, ]
y_train <- y[train_indices]
y_test <- y[-train_indices]</pre>
cat("Number of training samples:", nrow(X_train), "\n")
```

Number of training samples: 8001

```
cat("Number of training labels:", length(y_train), "\n")

## Number of training labels: 8001

cat("Number of testing samples:", nrow(X_test), "\n")

## Number of testing samples: 1999

cat("Number of testing labels:", length(y_test), "\n")

## Number of testing labels: 1999
```

LightGBM Model Training

Train a LightGBM regressor model. Categorical features are explicitly identified.

```
## [LightGBM] [Warning] Categorical features with more bins than the configured maximum bin number foun
## [LightGBM] [Warning] For categorical features, max_bin and max_bin_by_feature may be ignored with a
## [LightGBM] [Info] Auto-choosing row-wise multi-threading, the overhead of testing was 0.000182 secon
## You can set 'force_row_wise=true' to remove the overhead.
## And if memory is not enough, you can set 'force_col_wise=true'.
## [LightGBM] [Info] Total Bins 3323
## [LightGBM] [Info] Number of data points in the train set: 8001, number of used features: 14
## [LightGBM] [Info] Start training from score 134.796400
```

Model Evaluation

Evaluate the trained model on the test set using R-squared.

```
# Evaluate the model
predictions <- predict(model, as.matrix(X_test))

# Calculate R-squared
ssr <- sum((y_test - predictions)^2)
sst <- sum((y_test - mean(y_test))^2)
r_squared <- 1 - (ssr / sst)

cat("R-squared score on the test set:", r_squared, "\n")</pre>
```

R-squared score on the test set: -0.04445763

Model Insights

Let's examine the trained model by looking at feature importance and comparing actual vs. predicted values.

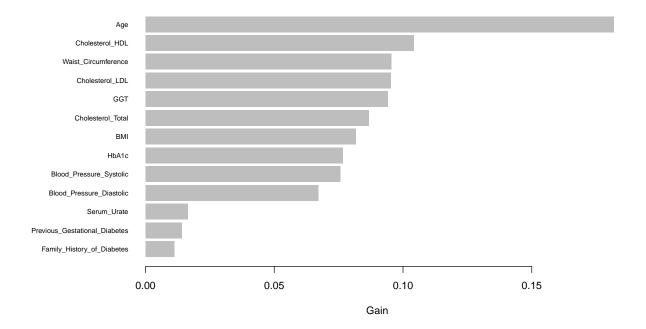

Feature Importance

Understanding which features the model considered most important for the prediction task.

```
# Calculate feature importance
importance <- lgb.importance(model, percentage = TRUE)

# Plot feature importance
lgb.plot.importance(importance, top_n = 15, measure = "Gain")</pre>
```

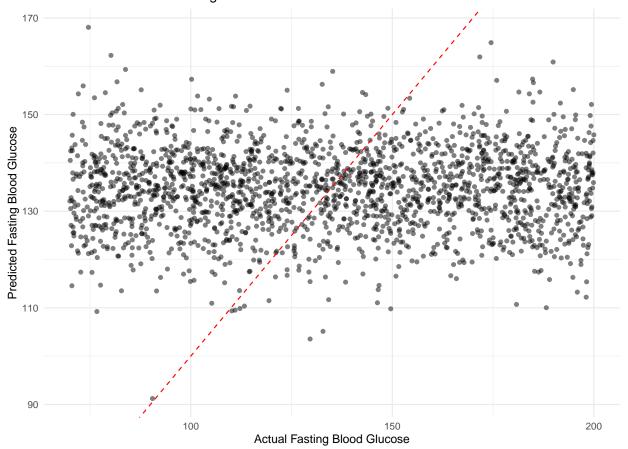

Feature Importance

Actual vs. Predicted Values

A scatter plot comparing the actual Fasting_Blood_Glucose values in the test set against the model's predictions. A perfect model's points would lie on the dashed red line (where Actual = Predicted).

Actual vs. Predicted Fasting Blood Glucose

Conclusion

The LightGBM model was trained to predict Fasting Blood Glucose. The R-squared score of -0.0445 on the test set indicates the model explains a small portion of the variance in the target variable (or performs worse than a simple mean if negative). Further steps could involve hyperparameter tuning for LightGBM

or exploring other modeling techniques to improve performance. The feature importance plot shows which variables were most influential in the model's predictions.
